Education

- **Imperial College London** **London, UK**
BEng Mechanical Engineering *Oct 2020 - June 2024*
Conducted research @ Aerial Robotics Lab, contributing to (Hauf et al., "Learning tethered perching for aerial robots," ICRA 2023) by building a drone simulation for training RL policies using ROS 2 and Gazebo

Experience

- **Member of Technical Staff** **San Francisco, US**
Lute One *Nov 2025 -*
 - Member of the Machine Learning team building and scaling neural networks for robotic manipulation.
 - Oversee data collection for a team of full time tele-operators and contributing to building the data pipelines and deployment stack for the models.
 - Focusing on model post-training, pushing autonomous long horizon manipulation to high (95+%) success rate using reinforcement learning.
- **ML Engineer** **San Francisco, US**
Irreverent Labs *Dec 2024 - April 2025*
 - Irreverent Labs is a research startup that built real time video generation models founded by seasoned veterans from Tesla, Microsoft Research, etc. I worked on post-training and productionizing the team's foundation video model for real-time character generation.
 - I built the inference infrastructure for efficient serving for real time inference across a multi-node GPU cluster for video models, image models, and LLMs.
 - Gained valuable experience on how video diffusion models on the scale of 1000+ H100 GPU clusters are trained.
- **AI Residency** **San Francisco, US**
K-Scale Labs *Sept 2024 - Dec 2024*
 - Researched, developed, and trained a VLA where we used a foundation video generation model as the backbone.
 - Implemented the architecture by adding an action expert head to the pre-trained diffusion transformer.
- **Founder In Residence** **London, UK**
Entrepreneur First *June 2024 - Sept 2024*
 - Selected for and participated in the Entrepreneur First SF cohort, which is a selective program that funds promising individuals to start companies.
 - I explored building a research startup focused on training world models. After demonstrating promising prototypes using compute grants worth \$10k+, we were offered investment worth several hundred thousand dollars in just a few months. But I decided it is better for me to join an established company at the time.
- **Research Assistant** **London, UK**
LSDS Group @ Imperial College London *Oct 2023 - June 2024*
 - Designed and built a distributed reinforcement learning with human feedback fine-tuning library.
 - Achieved better throughput up to 16 GPUs compared to state-of-the-art open source libraries.
 - Offloaded unused models to RAM to enable larger batch size on model being used.
- **Software Engineer Intern** **London, UK**
Morgan Stanley *June 2023 - Aug 2023*
 - Made tooling to log, trace, and visualize payments in the Kafka-based infrastructure.

Skills

- **Deep Learning;** Python, imitation Learning, generative models, computer vision, PyTorch, reinforcement learning **Distributed Training;** DeepSpeed, FSDP, Docker
